

Here are the steps I took to create my website – JS

1. Firstly I start my script.js with the most important tag. This makes sure the whole site is loaded.
2. I then decided to add a preloader with a gif image I grabbed of the internet (*reference: <http://preloaders.net/>*)
3. I added a delay of (450), this will set the time that the pre-loader is shown before my webpage loads, I added a fade out too.
4. For my popup contact form, I created a function so that when my form I created is clicked on the form appears. This is done by adding the 'toggle'
5. Similar to my contact form, I created a function for my hamburger nav so that when my design is viewed on a mobile device, I can click the hamburger and it will show my "mobilenav" ID I created.
6. Form validation is not quite working but I thought I would add the best I know in there!
